

# Ujwal and Chaudhary

## Comments

Page 3: Section 1.1 is a great way to start the proposal. This made it clear why you are working on this project in the first place. Also, the brief explanations of the technologies you are using (HOG and SVM) is wonderful. I have no issues with this section.

Page 4: For section 1.2, the Farm owners and livestock managers already has me asking questions such as: will the camera have night vision and will that be sufficient for the system to work? I am not at all saying that those answers have to be in this section or even in the proposal, but I do think it would be good to keep in mind while working on the project. The other two target audience groups were explained very well. For section 1.3, that first sentence seems like it should have a citation. The rest of section 1.3 looks great.

Page 5: Great diagram to start the page. This helps me visualize what goal you are trying to accomplish and what the layout will look like, great work. Great job pointing out the drawbacks to these already proven methods such as HOG and SVM struggling with poor backgrounds. Also great job reintroducing how your system will benefit this field of study.

Page 6: For your related works section, this would be a great place to buff up your proposal. I am pretty new to research papers as a whole, but I believe that 4 sources is pretty low for that section, also I mention it in the final comments but if you are graduate students, then Professor Stoytchev recommended 20 sources and this would be a great place to buff up the proposal. Great use of citations and explanations throughout the whole section. Also section 1.6 looks solid. Figure 2 is a great addition. This helped me tremendously in figuring out how all these pieces work together, great addition. Something that may help is explaining what the different parts of the system do as well as how they might work together, but this is tough to implement since the proposal was already 15 pages long and that is a good chunk of text.

Page 7: Section 2.2 looks great. I like how you break it up into stages in section 2.3. Reading through section 2.3 and the subsections, I have no issues.

Page 8: I would recommend making the diagram a little smaller in the following page so it shrinks into this page. There is a lot of empty space on this page and the diagram can fill it while keeping most of its size.

Page 9/10: The flowchart is great. Does a good job explaining what the algorithm will do. Section 2.3.5 is great, great explanations and solid use of a diagram to show what Streamlit looks like, no issues with this section.

Page 11: Great usage of a table. Makes everything clear and easy to read for those algorithms. Same with the second table. This page looks great.

Page 12: Liked how you made your testing plan clear. Table 3 did a great job of explaining the environment and tests. Also good how you explained where test footage is coming from. Great slides overall, no complaints.

Page 13: Section 3.3 is solid. I like the bullet point list, change up from the tables for the reader. Also throughout the text, I liked how you bolded the term but made it into a sentence, such as confusion matrix being bolded and explaining what it is in a continuous sentence. Another great use of a figure too to show how the boxes will be shown. The best part of this slide is including solidified numbers for your success metrics. I believe this will provide you a great benchmark to keep track of for testing.

Page 14: This is a section I am keeping note of for my final proposal because I thought section 3.5 was extremely useful. Including how you will better your project based off results shows that you have actually thought about how you will achieve your results. Also, section 4 looks great, no issues there.

## Final comments

This is an amazing start for the final proposal. One thing I would note is that there seemed to be some extra buzzwords. For example, I am copying and pasting this sentence from your essay: “The behavior classification layer is definitely where we’ll be doing the most iterating.” The word “definitely” doesn’t need to be added here, and I recommend Grammarly because I believe it should remove extra words such as this. Not sure if you knew but if your team are graduate students, I remember Professor Stoytchev saying in lecture that you should have a minimum of 20 sources. Just wanted to let you know, I believe this is still the case as well. Also, I thought the table of contents was a solid addition. Overall, great project!

The following is the guidelines sent from the Professor’s email, I will answer some of them just for extra feedback, but I will skip the ones that I believe I have already answered in the document:

2. On a scale of 1 (worst) to 10 (best), how would you rate the overall organization/clarity of the proposal? (1-10) :

I would rate it 8. The use of figures, tables, and explanations was wonderfully split and I thought this was a strong point of the essay.

3. On a scale of 1 (worst) to 10 (best), how would you rate the overall project idea? (1-10) :

I would rate it 10. This is an idea that could result in significant security improvements, especially in a world where there still seems to be trouble in identifying threats in video footage. This is a great project that I want to see be successful.

4. On a scale of 1 (not original at all) to 10 (extremely original), how would you rate the originality or creativity of the project idea? (1-10) :

I would rate it a 7. I imagine that there have been attempts at better security in video feeds before and I am sure they are going on now, but it is such an important topic that I believe any effort helps/

\* Overall, is the proposal clear, concise, and well-organized?

Yes, I genuinely feel that I could explain to someone else what your proposal was about. You provided good information, sources, statistics, and explained everything well.

\* Does the proposal meet the posted proposal guidelines?

Just wanted to re-mention the sources comment I had in the final comments about needing 20 sources for graduate students.
